

Limit User Input with a Macro  
WordPerfect Magazine  
Tips

There are times I need a macro to restrict user input to a specific number of characters, such as when prompting for a two-letter state abbreviation. Since there isn't a single command that does this, I use the included LIMIT.WPM macro.

The {CHAR} command only accepts one character, hence the use of two {CHAR} commands. To display what the user entered, the closing tilde (~) of the {CHAR} command is followed by the appropriate variable. This inserts the letter(s) into the document.
